Execution Summary

This dataset includes many different factors associated with aviation events, such as injuries, accidents, damage to aircraft, weather, and more. The primary objective of the project is to derive significant insights from this dataset in order to support the continuous improvement of aviation safety protocols and practices.

Methods and Approach:

Data Collection and Preprocessing: The Aviation Department dataset is collected and

preprocessed at the start of the project. To prepare the data for subsequent analysis, this entails cleaning it up, dealing with missing values, and guaranteeing data consistency.

Exploratory Data Analysis (EDA) - The report explores exploratory analysis using statistical methods and Power BI visualizations. It looks for patterns, trends, and correlations in the dataset. Understanding the links between many data, such as injury severity, aircraft damage, weather, flying phases, and more, is made easier with the help of visual representations.

Comprehensive Analysis - To find undiscovered insights, the study employs a variety of statistical and machine learning techniques to do a comprehensive analysis. Predictive modeling may be used to detect trends that lead to particular events or to foresee possible risk factors.

Principal Results:

Perceptive Results - Supported by data-driven analysis, this dataset offers perceptive conclusions regarding the events in the aviation sector.

Recommendations – This report makes suggestions for strengthening safety procedures, reducing risks, and raising general aviation safety requirements in light of the findings.

Visual Representations - This report makes use of Power BI visuals to provide aesthetically pleasing representations that facilitate understanding of intricate data patterns and relationships.

Practical Utility – In this report project's goal is to give aviation industry stakeholders a useful tool to support safety procedures and policies.

Data from year 1980 to 2022 is used here like this –

Introduction

International air travel safety standards are being improved in large part through aviation safety and the investigation of aviation occurrences. This report on the **Aviation** Department dataset is a thorough examination of a large dataset that includes numerous aspects of aviation occurrences.

Dataset provides a thorough overview of all occurrences that take place in the aviation domain. These incidents include everything from accidents to different kinds of injuries, damage severity to aircraft details, and even environmental conditions and flight phases. This report's goal is to better comprehend aviation mishaps by examining, analyzing, and extrapolating insightful information from this large dataset. The goal of this project is to provide a thorough resource with insightful information that may aid in the ongoing improvement of aviation safety procedures and practices.

Data Source Description

<https://www.kaggle.com/datasets/khsamaha/aviation-accident-database-synopses>

This dataset provides a thorough overview of aviation occurrences, including crashes, injuries of various degrees, damage assessments of aircraft, and specific aircraft data, such as weather and various flying phases. The main goal of this report is to examine these incidents, perform analysis, and draw important conclusions from this large dataset. The ultimate objective is to produce a tool that advances knowledge about aircraft accidents and provides data that may be useful in improving aviation safety protocols and practices. Through a thorough examination and analysis of this dataset with the help of power bi visualizations, the report seeks to offer a thorough grasp of aviation events, covering everything from environmental conditions to accidents, in order to support the continuous enhancement of safety protocols in the aviation industry.

The data sheet has around 47870 rows and 31 columns. This information shows the details about the Aviation Department.

Aviation dataset explanation table

ID	COLUMN NAME	DESCRIPTION	DATA TYPE
1	Event.Id	Shows the event unique id	INT
2	Investigation.Type	Shows the investigation type	VAR/CHAR
3	Accident.Number	Shows the particular number of accident	INT
4	Event.Date	Shows the date of event	DATE/TIME
5	Location	Shows the exact location	VAR/CHAR
6	Country	Shows the name of country	VAR/CHAR
7	Latitude	Shows the latitude	INT
8	Longitude	Shows the longitude	INT
9	Airport.Code	Shows the particular airport code	VAR/CHAR
10	Airport.Name	Shows the name of airport	VAR/CHAR
11	Injury.Severity	Shows the injury type	VAR/CHAR

12	Aircraft.damage	Shows the damage of aircraft	VAR/CHAR
13	Aircraft.Category	Shows the category of aircraft	DATE/TIME
14	Registration.Number	Shows the number of registration	INT
15	Make	Shows the make of aircraft	VAR/CHAR
16	Model	Shows the model of aircraft	VAR/CHAR
17	Amateur.Built	Shows the amateur built	VAR/CHAR
18	Number.ofEngines	Number of engines in aircraft	INT
19	Engine.Type	Type of engine working	VAR/CHAR
20	FAR.Description	FAR description of aircraft	VAR/CHAR
21	Schedule	Shows the schedule	VAR/CHAR
22	Purpose.of.flight	Explain the purpose of flight	VAR/CHAR
23	Air.carrier	Shows the name of air carrier	VAR/CHAR
24	Total.Fatal.Injuries	Shows the total fatal injuries	INT
25	Total.Serious.Injuries	Shows the count of total serious injuries	INT
26	Total.Minor.Injuries	Shows the count of total minor injuries	INT
27	Total.Uninjured	Shows the total number of uninjured	INT
28	Weather.Condition	Shows the weather condition	VAR/CHAR
29	Broad.phase.of.flight	Shows the broad phase of flight	VAR/CHAR
30	Report.Status	Shows the status of report	VAR/CHAR
31	Publication.Date	Shows the date of publication	DATE/TIME

Related Business Questions

A project on an online shopping portal requires the creation of a theory or framework, which requires an awareness of a variety of business, user experience, technology, and market trends (Zhang, J., Le, T. and Chen, J., 2023; Becker, L.T. and Gould, E.M., 2019).

Some of the business questions are as:

1. In which phase of the accident did the highest number of injuries occur and what is the count of accidents in such phase?
2. What is the name of the country where least number of accidents were recorded?
3. Which company's aircraft caused the highest number of accidents and injuries?
4. Which model of aircraft caused the most accidents?
5. How many such accidents occurred in which minor aircraft damage was recorded?
6. According to flight purpose, which flights had the highest number of accidents and injuries?
7. In which year the maximum number of air accidents occurred?

Report Objectives

Here are five report objectives for the project report on aviation dataset:-

- **Extensive Examination of Aviation Events:** Examine and evaluate the dataset that includes aviation incidents, accidents, injuries, aircraft damage, and related elements in great detail. With regard to the events, their underlying causes, and the connections found in the dataset, this goal seeks to present a comprehensive picture.
- **Assessment of Safety Practices and Procedures:** By establishing correlations between injury severity, weather, flight phases, and other variables, evaluate the efficacy of current aviation safety protocols and practices. In order to lower the risk of accidents and injuries, this goal seeks to pinpoint possible areas for safety measure enhancement.
- **Creation of Visual Tools for Data Representation:** Make use of Power BI visualizations to produce interactive tools and perceptive graphical representations that help users grasp the dataset in an easy-to-understand manner. The goal is to make difficult-to-understand aviation data visually clear for stakeholders to understand.
- **Finding Recurring Patterns, Trends, and Risk variables:** Look for patterns, trends, and risk variables related to aviation mishaps. These may include relationships between weather, flight objectives, engine types, and aircraft damage. This goal is to draw attention to possible trouble spots or high-risk elements that could lead to mishaps.
- **Suggestions for Improved Aviation Safety Procedures:** Produce definitive findings and suggestions derived from the dataset analysis. The aim of this study is to strengthen industry safety standards by suggesting practical changes and enhancements to current aviation safety practices.

These goals seek to take advantage of the comprehensiveness of the Aviation dataset in order to examine past events and get practical insights for enhancing aviation safety protocols.

Key Findings

The work done using Power Bi and dataset visualizations to address business problems will be reviewed in this part, along with pertinent findings and suggestions. (Answers of business questions)

1. Country Wise Number of Accidents and Injuries

The following dashboard shows the different countries in which most of aviation accident happened. The world map shown below has the complete locus of the countries with major accidents. This page shows that 41 countries was included in this analysis, in which total 47870 accidents took place.

Figure-1: Country Wise Number of Accidents and Injuries dashboard

Most Injured and Accidental Countries:

Figure-2: Graph-Most Injured and Accidental Countries

The Clustered column chart shows the number of total injuries and total accidents in countries around the world. The countries are listed on the right side of the graph, with the United States having the most 'total injuries', followed by the Pacific Ocean, the Atlantic Ocean, the Bahamas. The numbers on the left side of the graph show the number of total injuries and total accidents for each country. For example, the United States has 370636 total injuries and 47615 total accidents.

Most Injuries and Accident on Phase of Landing:

Figure-3: Graph- Most Injuries and Accident on Phase of Landing

The area line chart shows the number of ‘total accidents and total injuries by phase of accident’. The phases of accidents are listed on the bottom of the graph, from left to right: Landing, Takeoff, Cruise, Maneuvering, Approach, Climb, Taxi, Descent, Go-around, Standing, and Unknown. The numbers on the left side of the graph show the number of total accidents and total injuries for each phase of accident. For example, the Landing phase has 104K total accidents and 12.1K total injuries.

2. Aircraft Company and Model Wise Accident History

The below page of the dashboard shows the Aircraft Company and Model Wise Accident History through which most of aviation accident happened. There were total 9 aircraft categories having total 6880 aircraft models. There were total 4035 aircraft making companies, which aircraft accident analysis done.

Figure-4: Aircraft Company and Model Wise Accident History dashboard

Total Accidents According to Category of Aircraft:

Figure-5: Graph- Total Accidents According to Category of Aircraft

The graph shows the percentage of accidents by type of aircraft, where the aircraft types are listed on the left side of the graph and the percentage of accidents is shown on the right. The airplane has most accident took place, which are 46937 followed by Helicopter with total 699 aviation accidents

Total Accidents According to Model of Aircraft:

Figure-6: Graph- Total Accidents According to Model of Aircraft

The waterfall chart shows the total number of accidents for different aircraft models. The X-axis lists the aircraft models, while the Y-axis shows the number of accidents. The model '152' has most number of the total accident, followed by model 172N and 172. They have 1576, 802, 789 accidents respectfully.

KPI of Total Injuries of Accidents:

Figure-7: KPI-Total Injuries of Accidents

The above KPI shows the total number of injuries according to aircraft schedule, which is 1690.

Total Accidents According to Aircraft Making Company:

Figure-8: Graph- Total Accidents According to Aircraft Making Company

The Tree-map (tile map) shows a graph of the total number of accidents for different aircraft manufacturers, Aviation Accident and Incident Database. The data in the graph covers accidents that occurred between 1982 and 2020. The top 3 aircraft making companies are ‘Cessna, Piper and Beech’, having total accidents 16091, 8624, and 3122 respectfully.

3. Finding of the Total Injuries and Death of Accidents

The below page of the dashboard shows the Total Injuries and Death of Accidents in aviation accident. There were total 372278 injuries in all aviation accidents, of which 254175 injuries are serious and 98579 injuries are minor injuries.

Figure-9: Total Injuries and Death of Accidents dashboard

Total Accidents and Total Accidents:

Figure-10: Graph- Total Accidents and Total Accidents

The clustered bar chart shows the total number of accidents and injuries by flight purpose based on data the General Aviation Accident and Incident Database.

The top five flight purposes with the most accidents according to the graph are Personal flying - 28,065 accidents, Instructional flying - 6,316 accidents, Aerial application - 2,784 accidents, Business flying - 2,323 accidents, Ferry flying - 1,344 accidents.

Whereas the top five flight purposes with the most injuries are Personal flying - 220,978 injuries, Instructional flying - 50,182 injuries, Aerial application - 16,266 injuries, Business flying - 13,442 injuries, Ferry flying - 24,332 injuries respectfully.

Total Injuries According to Weather Conditions:

Figure-11: Graph- Total Injuries According to Weather Conditions

The line-Clustered column chart showing the total number of injuries and total accidents according to weather condition. The weather conditions are listed on the left side of the graph, and the number of injuries and accidents are shown on the right side.

The graph shows that the most common weather condition for both accidents and injuries is VMC (visual meteorological conditions), followed by IMC (instrument meteorological conditions) and OK (other known conditions).

Aircraft Damage Conditions:

Figure-12: Graph- Aircraft Damage Conditions

The pie chart shows the aircraft damage condition of various aircraft. Total 35176 aircrafts are substantial damaged whereas 11389 are destroyed completely.

Injuries Severity:

Figure-13: Graph-Injuries Severity

The clustered column chart shows the injuries severity of aviation accidents. The 'Non-Fatal type injuries' are higher than other type of injuries. There were total 200204 injuries of serious category in Non-Fatal Severity.

However, Incident type injury severity are much lower than other injuries severity.

4. Accidents and Injuries of Aviation Accidents by Time-Duration

The below page of the dashboard shows the Accidents and Injuries of Aviation Accidents by Time-Duration. There were total 47870 aviation accidents. The number of airlines surveyed were 1664 in 41 countries worldwide.

Figure-14: Accidents and Injuries of Aviation Accidents by Time-Duration dashboard

Month wise total Accidents:

Figure-15: Graph- Month wise total Accidents

The clustered column chart shows the number of accidents per month for commercial aviation, general aviation, and air taxis/charter operations. The y-axis appears to show the number of accidents whereas the x-axis appears to show the months of the year.

The July, August and June months has most number of aviation accidents, which are 5.9K, 5.4K and 5.1K

It looks like the number of accidents for all three categories is highest in the summer months and lowest in the winter months.

Month wise total Injuries:

Figure-16: Graph- Month wise total Injuries

The clustered column chart visualize the "Monthly Wise Total Injuries. The X-axis labelled "Month," it likely shows the months of the year whereas the Y-axis labelled "Total Injuries".

The month July, August and June has the most number of injuries which are 45K, 41K and 40K respectfully. However, the month February has the lowest number of injuries i.e. 21K only.

Year wise total Injuries:

Figure-17: Graph- Year wise total Injuries

The clustered column chart titled as "Yearly Total Injuries (Top 5)" with data apparently from the year 2002 to 2006.

The X-axis labelled "YEAR," it shows the top 5 years from the dataset which are from 2002 to 2006. The Y-axis labelled "TOTAL INJURIES," it likely represents the total number of injuries recorded within each year.

Year wise total Accidents:

Figure-18: Graph- Year wise total Accidents

The above pie chart shows the top 5 year in which most numbers of accidents took place. The top 5 years are 1982, 1987, 1988, 1989 and 1990. The year 1982 has most number of accidents which are 3519 followed by year 1987 having 2713 accidents.

Conclusions

To sum up, the thorough examination of the **Aviation dataset** has yielded insightful information about a range of aviation-related topics. This report provides a comprehensive summary of incidents ranging from accidents to various injury types and damage severity by exploring characteristics like Event ID, Investigation Type, and Aircraft Category. The principal objective of the research was to augment comprehension of aircraft accidents and facilitate continuous enhancements in safety protocols. This report has effectively provided a thorough picture of aviation occurrences, spanning everything from environmental conditions to accidents, through the usage of Power BI visualizations. In the end, the project is a useful tool that supports the ongoing improvement of aviation safety procedures and practices.

While studying all the points, we have reached some general conclusions which are as follows:

- The number of accidents and injuries occurring at the time of landing was highest.
- The United States has the highest number of accidents.
- Aircraft model number 152 caused the most accidents.
- Highest number of air accidents were recorded in the year 1982

Recommendations

- Cessna company should be honored for having the least number of accidents.
- Aircraft company should work to improve the quality of its model number 152.
- The aircrafts which are having reciprocating type engine should either replace it or improve it.

Data Cleansing & Transformation Steps

Data transformation in Power BI Desktop empowers to shape raw data into meaningful insights. It acts as sculpting tool, transforming messy, disorganized data into a polished masterpiece ready for analysis. Someone can cleanse and restructure data, calculate new measures, merge datasets, and even pivot tables to gain different perspectives. Power BI offers a visual interface with intuitive tools like M Query and the Query Editor, making data transformation accessible even for non-programmers.

In order to transform the data set, click on “Transform data” option available in the ribbon menu.

Figure-22: Data Transformation Option

Figure-24: Null Columns in Dataset

- The null column can removed by two ways,
 - (a) Either by options “remove Columns” in Ribbon tab or
 - (b) By clicking right column on null column header.

Figure-25: Removing Null Columns

Removing Null values in Column

- Delete null values from Power BI data sets helps in preventing the problems. We may make sure that your analyses and visualizations are based on valid and full data by eliminating null values.
- Removing null values can also speed up the processing of your Power BI dashboards and reports because it will require less data to analyze.
- If any column is having null then it can be replaced using replace values.
 - From column aircraft.Category

Adding an Index Column

- Power BI Desktop lets us easily add an index column to our data tables, offering several ways to customize its numbering. The "Add Column" tab provides a simple "Index Column" option, automatically assigning sequential numbers starting from 0. Alternatively, we can configure the starting number, increment, and even choose "Custom" to define your own unique numbering logic. These index columns can prove

valuable for sorting visuals, tracking order, or supporting other transformation patterns within your Power BI reports.

Figure-33: Index Column Option

Bi Data Modeling

Fact and Dimension in Datasheet

Dimension Table:

- In a data warehouse, a dimension table is a table that contains dimensions—the descriptive information about the data/information. Time, location, product, customer, and employee are a few examples of dimensions.
- The dimension table is a crucial part of the Star Schema. The dimensions along which the values of the attributes are taken in the fact table are included in a dimension table.

Fact Table:

- A fact table is a table in a data warehouse that stores quantitative data or metrics, also known as facts. These facts are typically numerical measures, such as sales revenue, quantity sold, or profit.
- Fact tables also contain foreign keys that link to the primary keys of related dimension tables. These relationships enable analysts to combine quantitative data with descriptive attributes for comprehensive analysis.

Difference between Fact and Dimension Table

Feature	Fact Tables	Dimension Tables
Purpose	Stores quantitative, measurable data	Stores descriptive, contextual data
Granularity	Contains the most granular level of detail	Contains aggregated or summarized information
Structure	Typically contains many rows	Typically contains fewer rows
Primary key	Often a composite key, combining multiple dimensions	Usually has a single primary key, uniquely identifying each entity
Relationships	Connected to multiple dimension tables via foreign keys	Typically not directly connected to other dimension tables
Data types	Primarily numeric values	Primarily text or descriptive values, but can include dates or codes

Dimension Dim_Aircraft_info

The “Dim_Aircraft_info” table contains the following columns-

- i. Obj_ID
- ii. Aircraft.Category
- iii. Number.of.Engines
- iv. Registration.Number
- v. Make
- vi. Model
- vii. Amateur.Built
- viii. Engine.Type
- ix. FAR.Description

Figure-43: Loading of Dimension and Fact Table

List of Fact and Dimensions Tables

- The list of all fact and dimension tables can be seen in right-top side of the power-bi screen.
- Here in the following image, the list of fact and dimension can be seen.

Figure-44: List of fact and dimensions in power-Bi

Data models and relationships

A star schema is a type of data model that resembles a star, with a central fact table surrounded by dimension tables. The fact table contains the quantitative data, such as sales figures, website visits, or product inventory. Each dimension table provides descriptive information about a specific aspect of the data, such as customers, products, time-periods, or locations

Star Schema [one-to-one relationship]

- The Star Schema is a popular data modeling technique used in the design of data.
- It organizes data into a central fact table surrounded by dimension tables.
- The central concept resembles a star, with the fact table at the center and dimension tables radiating out like points on the star.
- This design simplifies querying and reporting, making it easier for analysts to retrieve and analyze information.

Benefits of the Star Schema [one-to-one relationship]

- **Simplicity:** The structure is straightforward, making it easy to understand and use.
- **Query Performance:** Queries involving the fact table and one or more dimension tables can be efficient, as the relationships are well-defined.
- **Flexibility:** It allows for easy expansion by adding new dimensions or modifying existing ones without affecting the entire schema.

Figure-55: Home page of Dashboard

The buttons, which are used on the home page, are:

- i. Home
- ii. Country
- iii. Aircraft
- iv. Injuries and Death
- v. Timely Accident

These buttons can be used to navigate on the dashboard. For jumping on the required page, use “ctrl + click”.
